Architecture

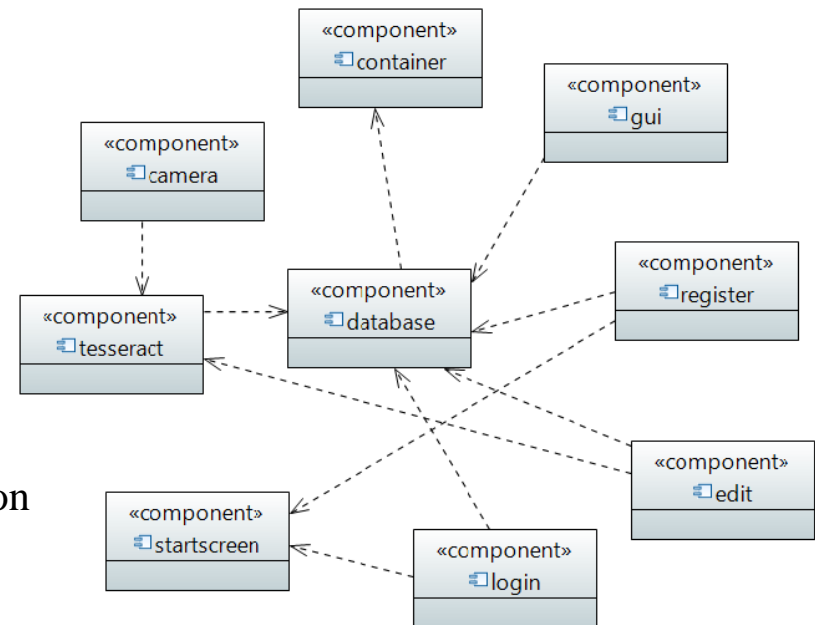

How it all began...

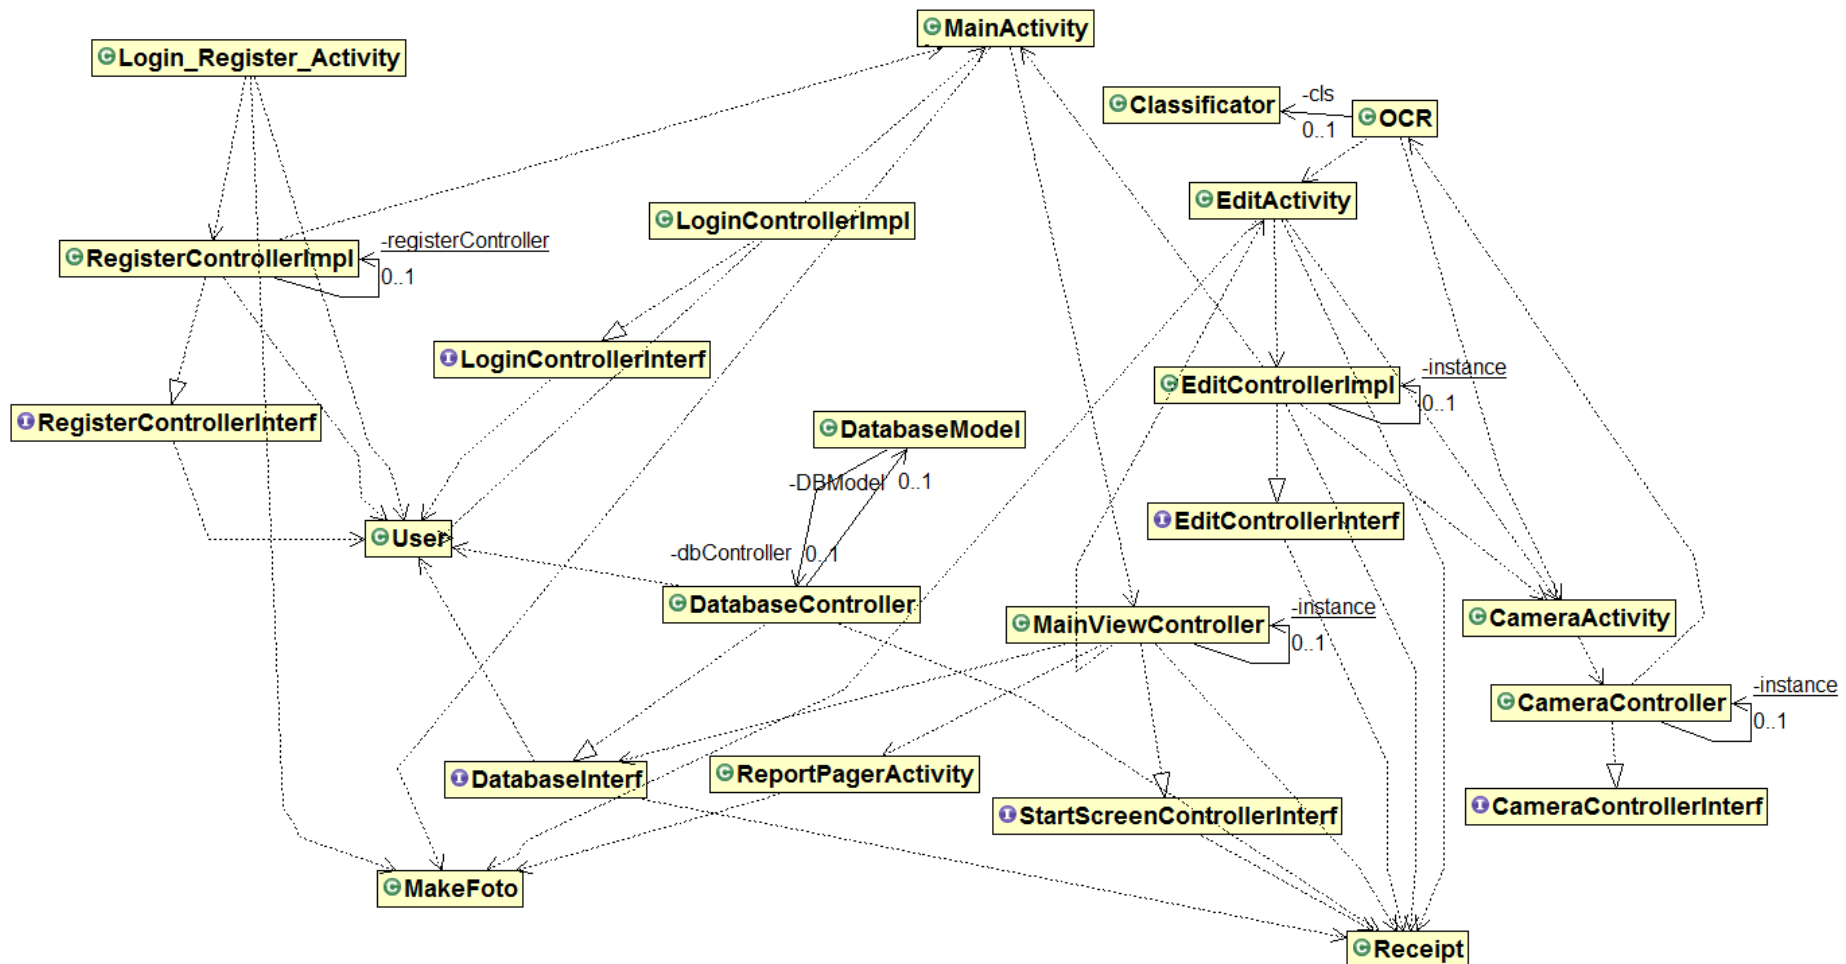

- ▼ camera
 - CameraController
 - CameraControllerInterf
- ▶ container
- ▶ database
- ▶ edit
- ▶ gui
- ▶ login
- ▶ register
- ▶ reports
- ▶ startscreen
- ▶ statics
- ▶ tesseract

Project Structure:

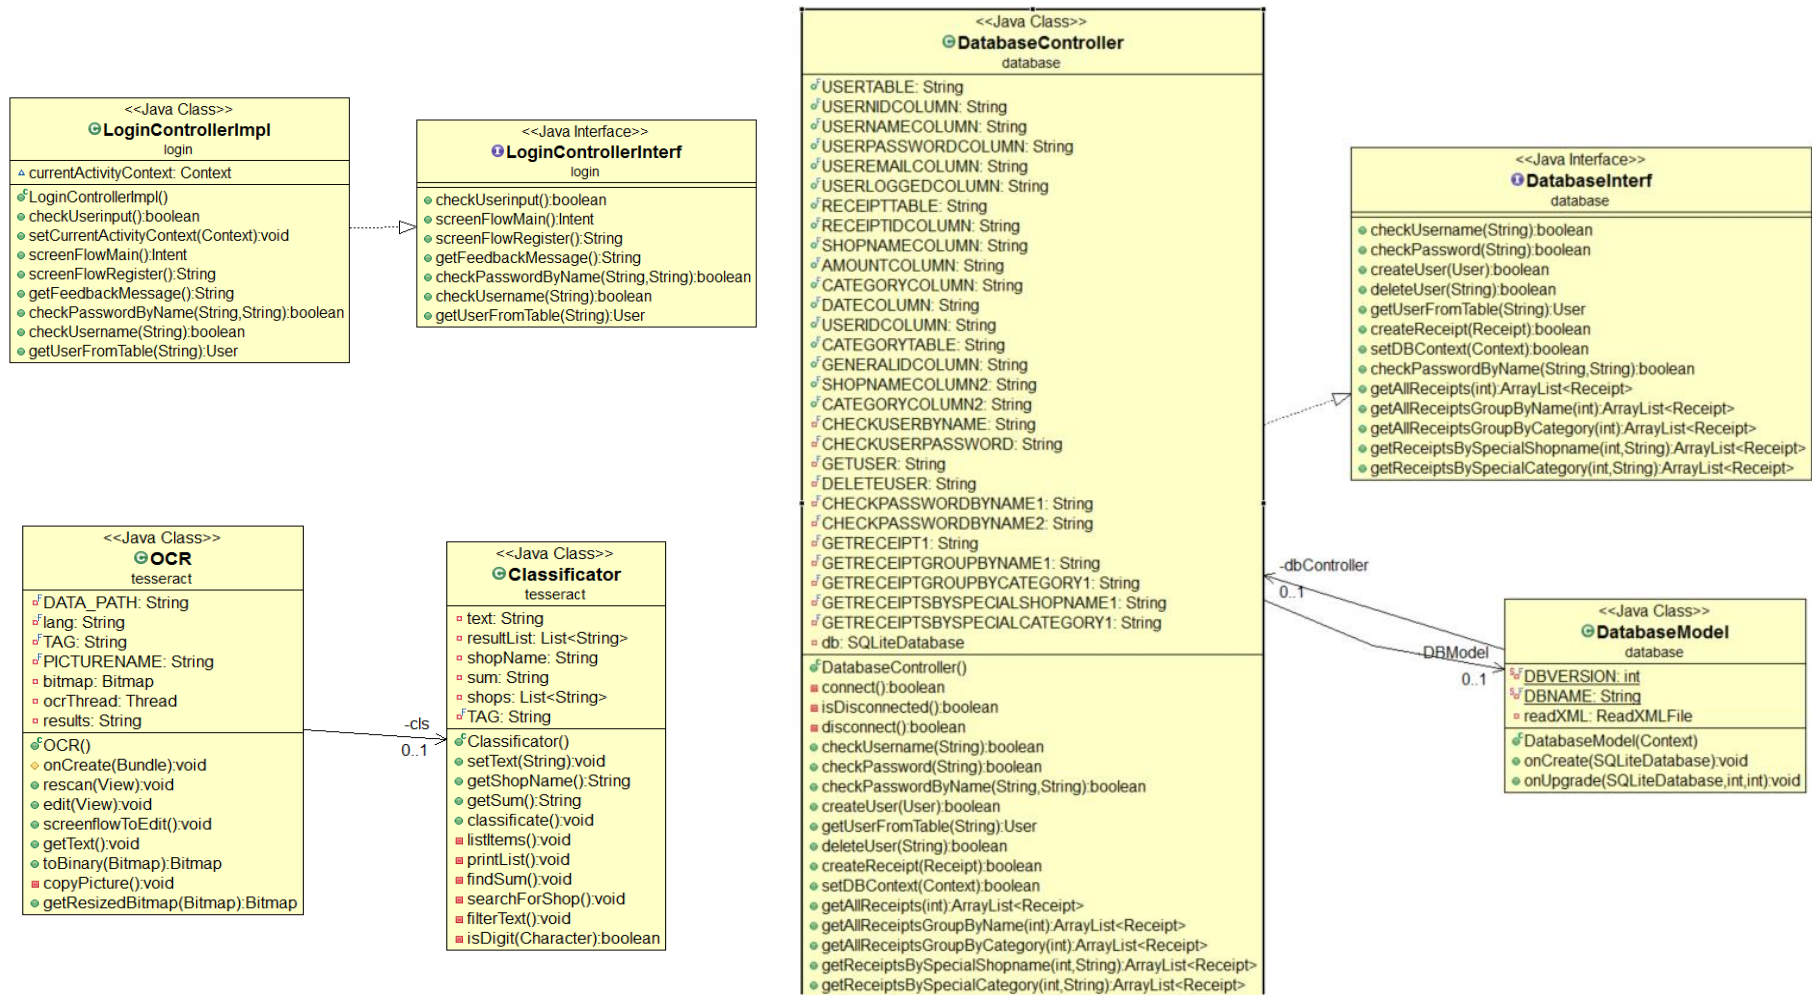

- division into 9 components
- full rebase: controller/implementation

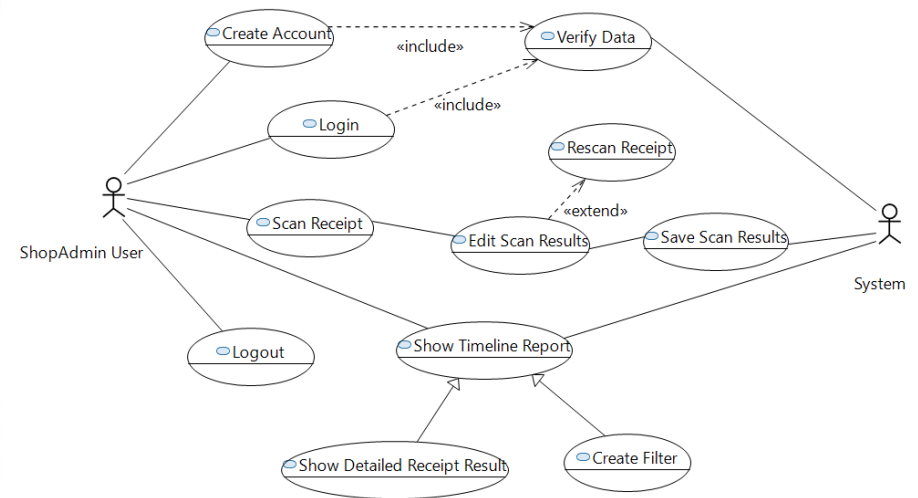

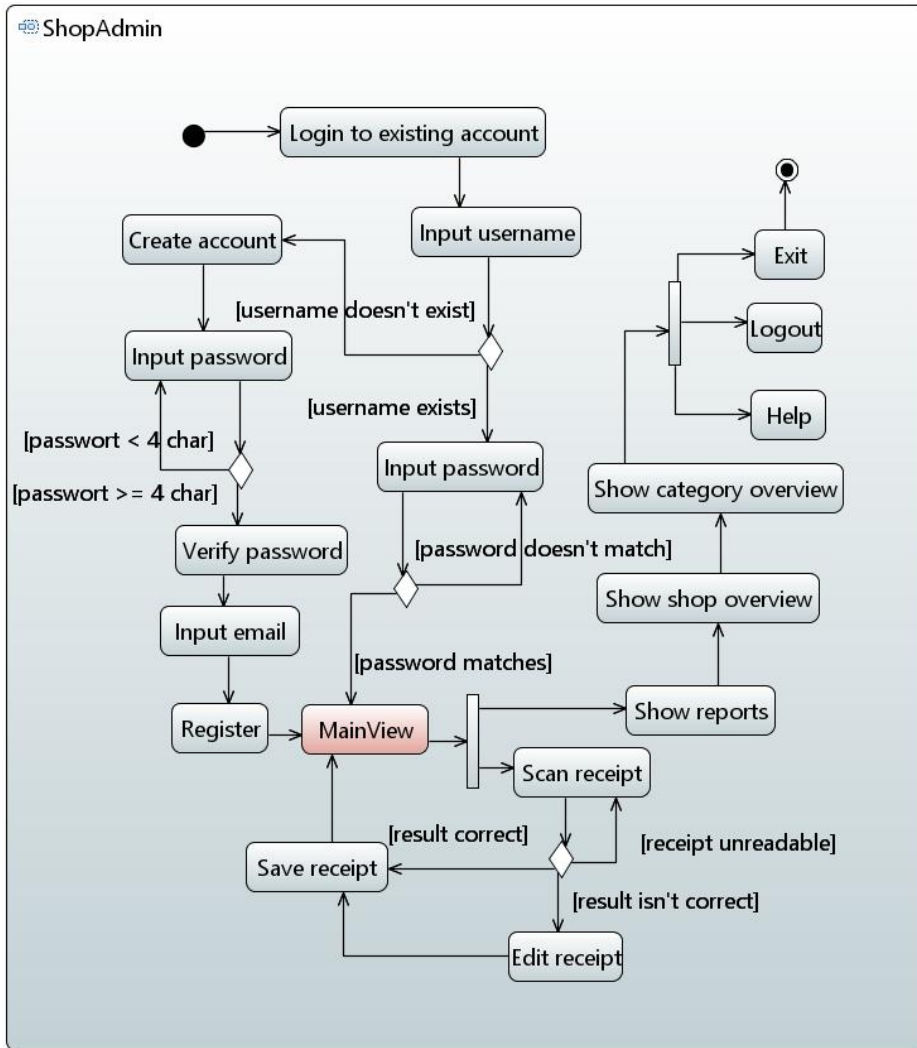

It became more and more complicated...

ANDROID DETAILS

RECEIPT EXTRACTION

CONCLUSION

- Use camera orientation to rotate picture
- Resize image to 2000 x 1200 pixel
- Colored image to black and white
- Tesseract train language deu_frak

- Pre analysis
- Filter insignificant symbols
- Combine single letters
- Levenstein-algorithm
- Post result adaption

- Orientation misleading - does not represent picture orientation
- Tesseract can not detect bold or large fonts
- Shop name classification highly depends on name length
- Receipt sum detection is very depending on OCR results

TESTS & STATISTICS : HOW TO MAKE THE PHOTO

good lighting	
flashlight	without flashlight
90%	85%

bad lighting	
flashlight	without flashlight
85 %	5 %

text style	
normal	bold
90%	1%

folded receipt	
no	yes
90%	30 %

LIVE DEMO

APPROACH

DETAILS

CONCLUSION

- Some Key-functionalities couldn't be finished during the semester. Major Topics are:
 - Session handling
 - Group functionalities
 - Online Database
 - Advanced filter possibilities for Reports
 - Advanced picture processing

ShopAdmin

Control expenses app with receipt scanner

Vision

Whom is it for?

students or young family.

Functionality:

- Manually enter your outgoing transactions
- Scanners that auto-extract receipt information such as shop names, data and time, amount

What problems does it solve?

Save time for counting expenses.

Challenges:

- Using Android for the first time
- Implementing Tesseract Library OCR engine and Leptonica Image Processing Library
